Mapping renewable energy in the Blue Pacific 2050

This visual explores the energy transition across countries and territories covered by the Blue Pacific 2050: Climate Change and Disasters indicator set, specifically focusing on energy transition and mitigation. It highlights two key metrics: the renewable energy share in total final energy consumption and installed renewable electricity-generating capacity per capita [2022]. The Tridacna shell serves as a visual metaphor for strength, sustainability, and layered transformation. Each shell's rings reflect the renewable share, while the coloured circle beneath scales installed capacity per person and is colour-coded by subregion. Icons show renewable types and electricity access. The chart reveals nuanced patterns: countries with high capacity don't always achieve a high share of renewables, and some with near-universal electricity access still rely heavily on fossil fuels. These contrasts reflect the diverse pathways Pacific nations take towards clean energy, shaped by infrastructure, geography, and political will. Renewable energy data are from 2022 and may not capture the latest developments. Electricity access data come from Thematic Area 4 [Blue Pacific 2050]; 2020 values were used throughout to ensure comparability despite uneven data availability.

How to read this chart:

Country/Territory
10% | 50W/capita
1% 100%

Renewable share [% of total energy mix] and installed renewable capacity [W/capita]

Icons show all renewable types used; filled icon = main source

Bar length = % of population with electricity access

Solar
Hydropower
Bio
Geothermal
Wind

Number of rings = % of renewable energy in total energy mix

1%
5%
10%

Size of the circle = installed renewable electricity-generating capacity per capita; Colour of the circle = subregion

Melanesia
Micronesia
Polynesia
